

Lab 0.1 Edge Computer and Headless Environment Setup

Learning Goals

Students will be able to:

1. Model the essential steps to setup network connection to Raspberry Pi
2. Contrast the different network connection options available for Raspberry Pi
3. Perform basic setup and get access to Raspberry Pi in headless system

1.1 Introduction

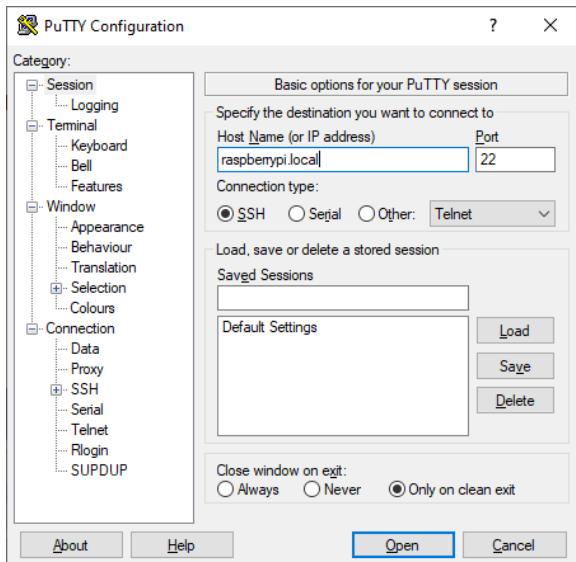

Headless and remote access allows us to control and manage the edge device without hardware interface and visiting the site. In this lab, you will do basic setup and make the wireless or wired connection of Raspberry Pi to a network and access it using SSH and VNC software.

1.2 Access to Raspberry Pi using SSH

In this section we will access Raspberry Pi using SSH via the ethernet cable. In Prelab 1, you've install PuTTY on your laptop. PuTTY will be used for SSH software for Windows. If you are using Linux, let TA know. Follow the steps below.

1. Run PuTTY on your laptop
2. Use *raspberrypi.local* for Host Name

※ Note that default port number for SSH is 22.

3. Click 'Open'
4. Click 'Accept' in PuTTY Security Alert

** You will see Security Alert message as below. This case is okay because we know the Raspberry Pi is connected to the laptop. But be careful when you get access to SSH machine in open network.*

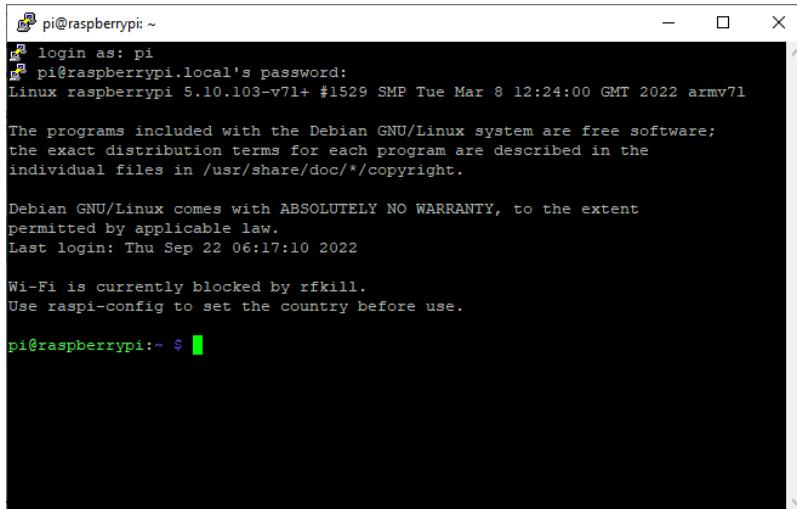

5. Default user credential is below.

user: pi

> password: raspberrypi

You will see the terminal window of Raspberry pi as Figure 1. This is SSH access to headless computer. Through SSH, you can do all: setup, manage file systems, write code, install packages, and so on.

```
pi@raspberrypi: ~
[pi] login as: pi
[pi] pi@raspberrypi.local's password:
Linux raspberrypi 5.10.103-v7l+ #1529 SMP Tue Mar 8 12:24:00 GMT 2022 armv7l

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*copyright.

Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
permitted by applicable law.
Last login: Thu Sep 22 06:17:10 2022

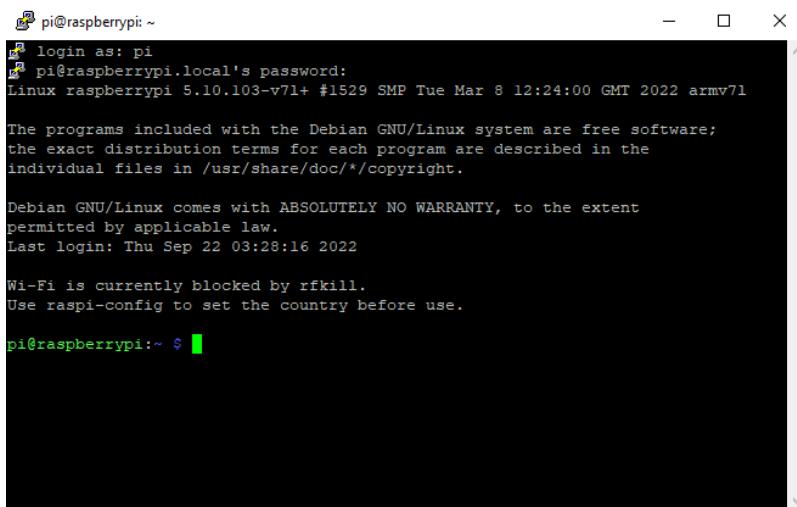

Wi-Fi is currently blocked by rfkill.
Use raspi-config to set the country before use.

pi@raspberrypi:~ $
```

Figure 1 SSH access to Raspberry Pi

Task 1.1

Capture your PuTTY window after login to Raspberry Pi as Figure 1 and attach it to the report below:

```
pi@raspberrypi: ~
[pi] login as: pi
[pi] pi@raspberrypi.local's password:
Linux raspberrypi 5.10.103-v7l+ #1529 SMP Tue Mar 8 12:24:00 GMT 2022 armv7l

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*copyright.

Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
permitted by applicable law.
Last login: Thu Sep 22 03:28:16 2022

Wi-Fi is currently blocked by rfkill.
Use raspi-config to set the country before use.

pi@raspberrypi:~ $
```

1.3 Basic setup of Raspberry Pi

Now, you can access Raspberry Pi from your laptop using SSH via an Ethernet cable. Even if your laptop can use the Internet, Raspberry Pi is not because we haven't make the Internet connection yet. We will deal with the Internet sharing in the next section. Before that, let's do basic configurations for Raspberry Pi such as 'Country', 'Keyboard', 'Timezone', and so on.

The essential configurations can be set up using 'sudo raspi-config' command.

Raspberry Pi - Linux - Terminal

```
sudo raspi-config
```

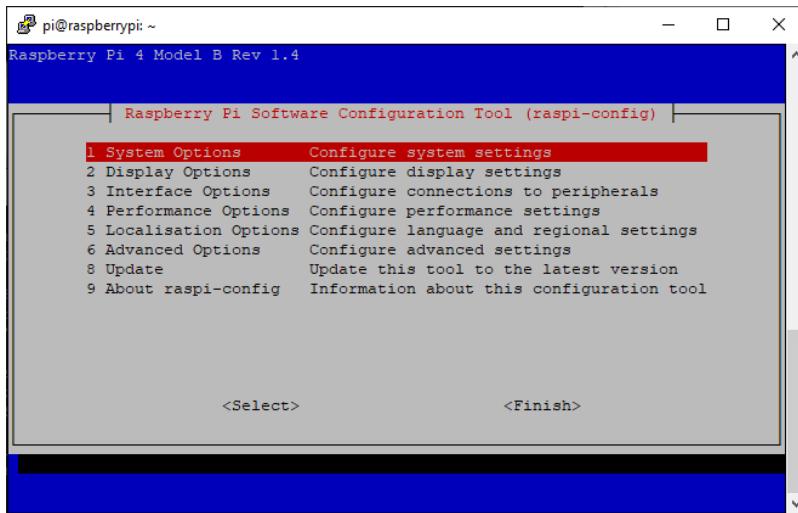

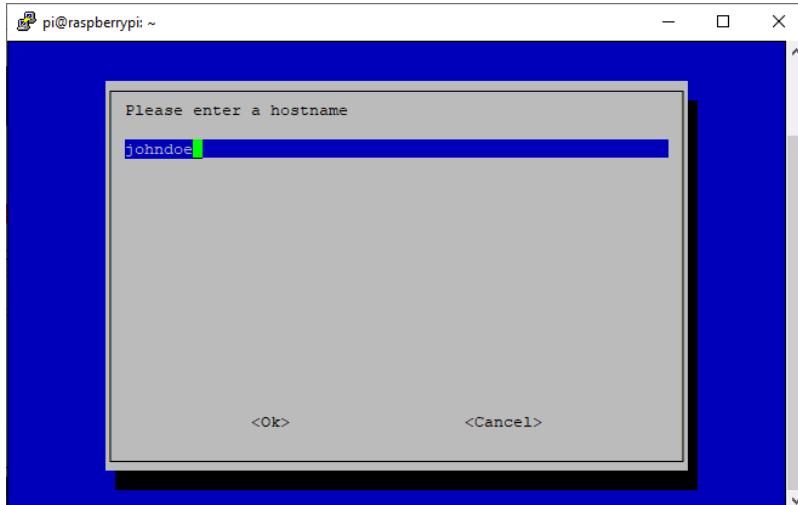

Figure 2 Raspberry Pi Configuration Tool

※ sudo is a Linux command meaning 'super user do'. This command means execute raspi-config command in super user (root/admin) privilege.

Figure 2 shows an interface windows of 'raspi-config'. You use keyboard (number keys, arrow keys, Enter, ESC, Space, etc.) to manipulate the configuration setting. Try to move using keyboard. For the basic configurations, follow the steps below.

1. Change hostname (computer name) as your 'firstname.lastname' (ex) johndoe)

Location: System Options/Hostname

2. Change password

| Location: System Options/Password

※ You have to memorize your password.

3. Enable 'VNC' interface

| Location: Interface Options/VNC

4. Change timezone to 'US/Eastern'

| Location: Localisation Options/Timezone

5. Change WLAN country to 'US United States'

| Location: Localisation Options/WLAN country

6. Finish (save) raspi-config

※ Raspberry Pi may ask you 'Would you like to reboot now?' If you choose , you can skip step 7.

7. Reboot Raspberry Pi using the command below

Raspberry Pi - Linux - Terminal

```
sudo reboot
```

※ We will frequently use 'sudo reboot' after configuration changes, package installations, and so on so that the changes can be reflected properly.

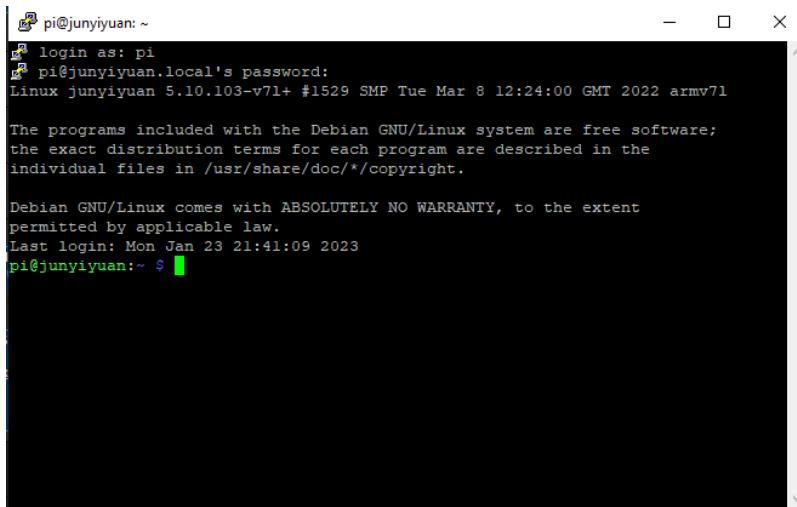

※ If you execute 'sudo reboot', the ethernet connection must be inactive because the Raspberry Pi restarts.

Now, you finished basic setup for Raspberry Pi other than the network connection.

Task 1.2

Capture your PuTTY window after rebooting as Figure 1 and attach it to the report below:

※ You have to use a new host name to access Raspberry Pi. For example, the host name in PuTTY is johndoe.local. The login account is the same (pi) but the password is changed.

```
pi@junyiyuan:~  
pi login as: pi  
pi@junyiyuan's password:  
Linux junyiyuan 5.10.103-v7+ #1529 SMP Tue Mar 8 12:24:00 GMT 2022 armv7l  
  
The programs included with the Debian GNU/Linux system are free software;  
the exact distribution terms for each program are described in the  
individual files in /usr/share/doc/*copyright.  
  
Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent  
permitted by applicable law.  
Last login: Mon Jan 23 21:41:09 2023  
pi@junyiyuan:~ $
```

1.4 Assign static IP and the Internet connection sharing

In this section, we will make the Raspberry Pi use the Internet by routing network of the laptop. We first assign static IP addresses for both laptop and the Raspberry Pi. For the network sharing and routing, we will use the Internet sharing of your Windows machine so that the Raspberry Pi can get the Internet access through your laptop. Note that your laptop must be connected to the Internet.

The ethernet IP of your laptop will be `192.168.137.1` and the ethernet IP of Raspberry Pi will be `192.168.137.2`, as shown in Figure 3.

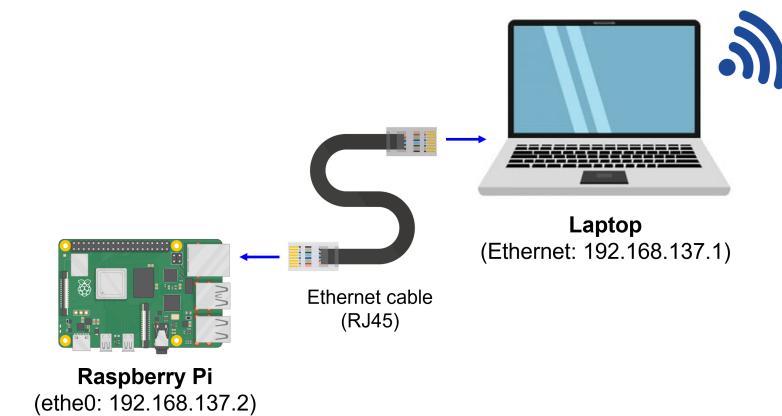

Figure 3 Wired connection configuration between Raspberry Pi and laptop

Let's set up your Raspberry Pi. Follow the steps below after get access to the Raspberry Pi using PuTTY.

1. Type `sudo nano /etc/dhcpcd.conf`

※ This command line means edit 'dhcpcd.conf' file at '/etc' directory using 'nano' editor in the root privilege.

2. Write the following at the end of the 'dhcpcd.conf' file.

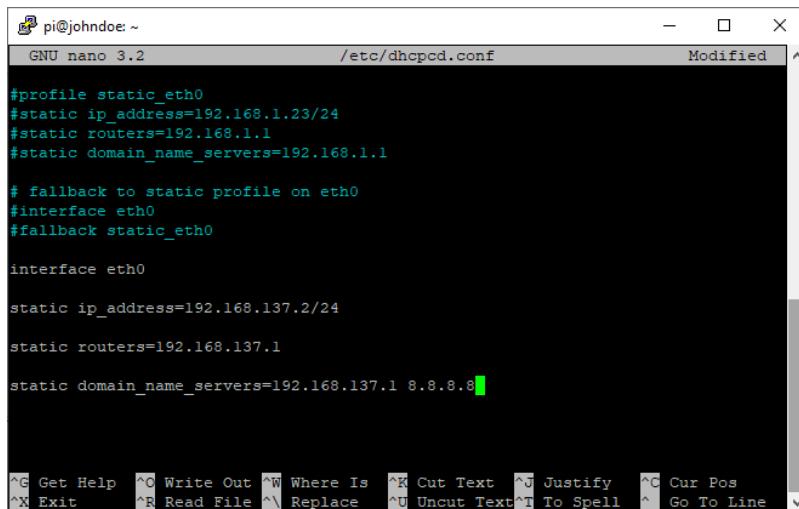

Raspberry Pi - /etc/dhcpcd.conf

```
interface eth0

static ip_address=192.168.137.2/24

static routers=192.168.137.1

static domain_name_servers=192.168.137.1 8.8.8.8
```

```
pi@johndoe: ~
GNU nano 3.2          /etc/dhcpcd.conf      Modified ^

#profile static_eth0
#static ip_address=192.168.1.23/24
#static routers=192.168.1.1
#static domain_name_servers=192.168.1.1

# fallback to static profile on eth0
#interface eth0
#fallback static_eth0

interface eth0

static ip_address=192.168.137.2/24

static routers=192.168.137.1

static domain_name_servers=192.168.137.1 8.8.8.8

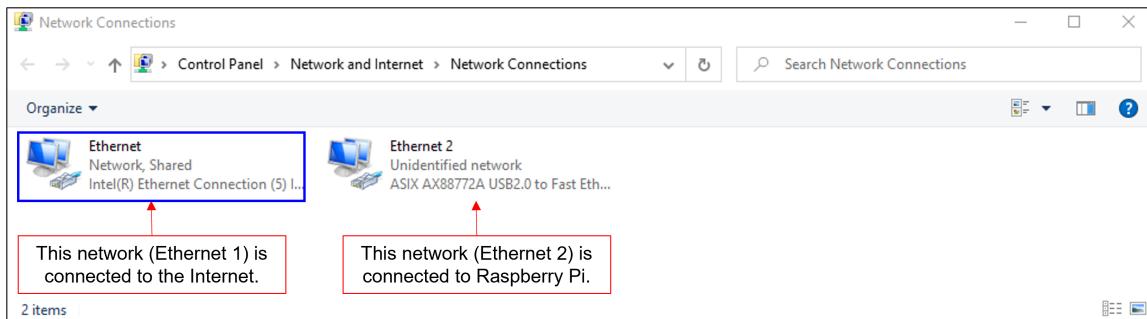

^G Get Help  ^C Write Out  ^W Where Is  ^K Cut Text  ^J Justify  ^C Cur Pos
^X Exit     ^R Read File  ^\ Replace   ^U Uncut Text  T To Spell  ^ Go To Line
```

※ You can easily paste the text using right-click of your mouse on the PuTTY window after copying the text.

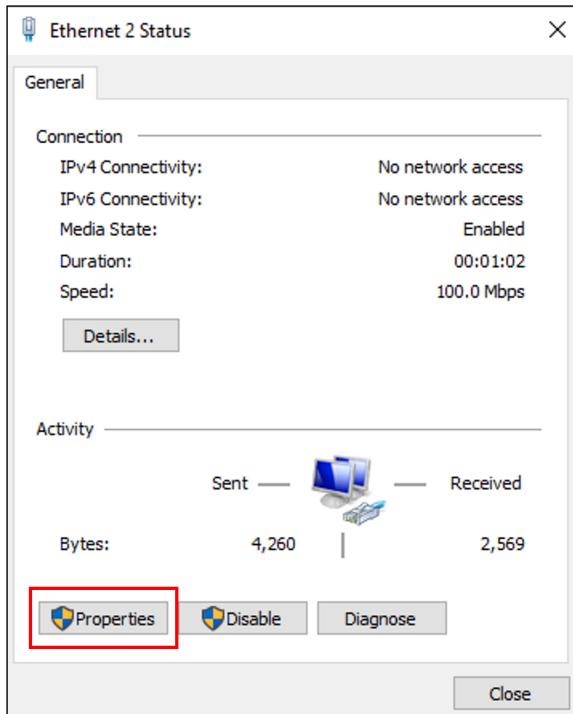

3. Save this configuration file (Shortcut: Ctrl+o)
4. Exit this configuration file (Shortcut: Ctrl+x)
5. Reboot the Raspberry Pi in the terminal using `sudo reboot` command and then unplug the ethernet cable temporarily.

Next, let's set up your laptop (Windows 10). Follow the steps below.

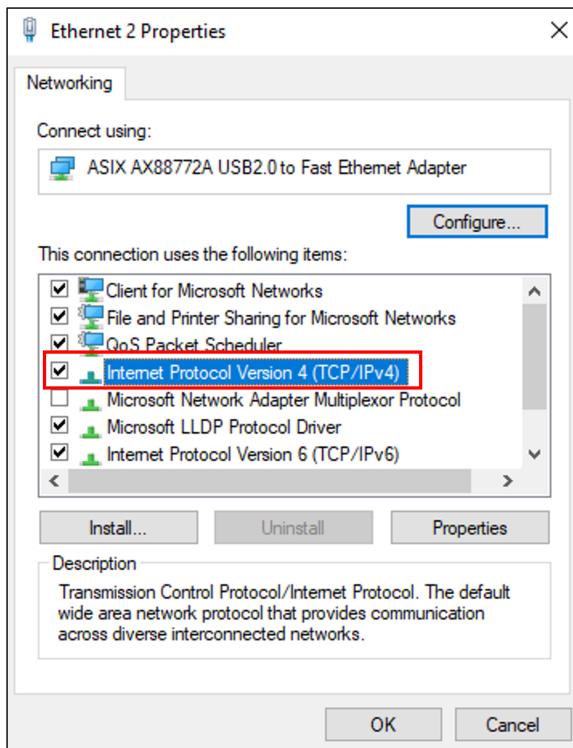

1. Open 'Network Connection' in 'Control Panel'

2. Double click the network connected to Raspberry Pi ('Ethernet 2' in this example)
3. Click '*Properties*'

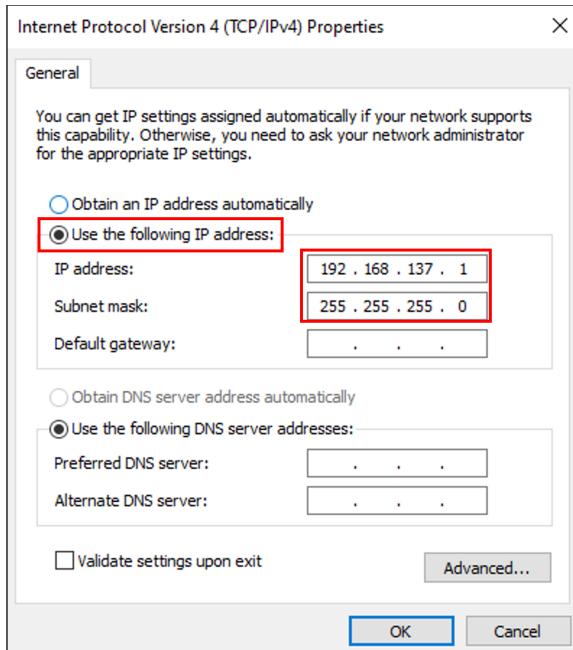

4. Double click '*Internet Protocol Version 4 (TCP/IPv4)*'

5. Click '*Use the following IP address*'

6. Set '*IP address*' and '*subnet mask*' as followed:

- | IP address: 192.168.137.1
- \
- | Subnet mask: 255.255.255.0

7. click '*OK*'

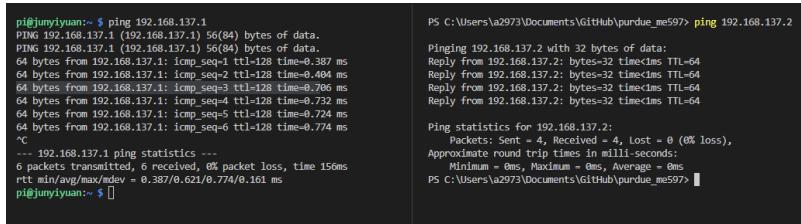

Now, static IP assignment for the wired (ethernet) connection is done. Plug the ethernet cable into Raspberry Pi again. Then, access it using PuTTY. You can use the same host name. Let's see if it works using ping test by performing Task1.3.

Do you think the static IP address of the Raspberry Pi can be used as the host name for SSH access in PUTTY? Try it!

Task 1.3

Capture your ping test results from both machines each other and attach those to the report below:

* If you want to halt a process or execution in the terminal, the shortcut is *Ctrl+c*.

The image shows two terminal windows side-by-side. The left window is on a Linux system (pi@jinyiyuan) and shows the command \$ ping 192.168.137.1 followed by its output. The right window is on a Windows system (PS C:\Users\...) and shows the command ping 192.168.137.2 followed by its output. Both outputs show a series of ICMP echo requests and replies with their respective times and TTL values.

```
pi@jinyiyuan:~ $ ping 192.168.137.1
PING 192.168.137.1 (192.168.137.1) 56(84) bytes of data.
PING 192.168.137.1 (192.168.137.1) 56(84) bytes of data.
64 bytes from 192.168.137.1: icmp_seq=1 ttl=128 time=0.387 ms
64 bytes from 192.168.137.1: icmp_seq=2 ttl=128 time=0.404 ms
64 bytes from 192.168.137.1: icmp_seq=3 ttl=128 time=0.706 ms
64 bytes from 192.168.137.1: icmp_seq=4 ttl=128 time=0.732 ms
64 bytes from 192.168.137.1: icmp_seq=5 ttl=128 time=0.724 ms
64 bytes from 192.168.137.1: icmp_seq=6 ttl=128 time=0.774 ms
```
-- 192.168.137.1 ping statistics --
6 packets transmitted, 6 received, 0% packet loss, time 156ms
rtt min/avg/max/mdev = 0.387/0.621/0.774/0.161 ms
pi@jinyiyuan:~ $
```

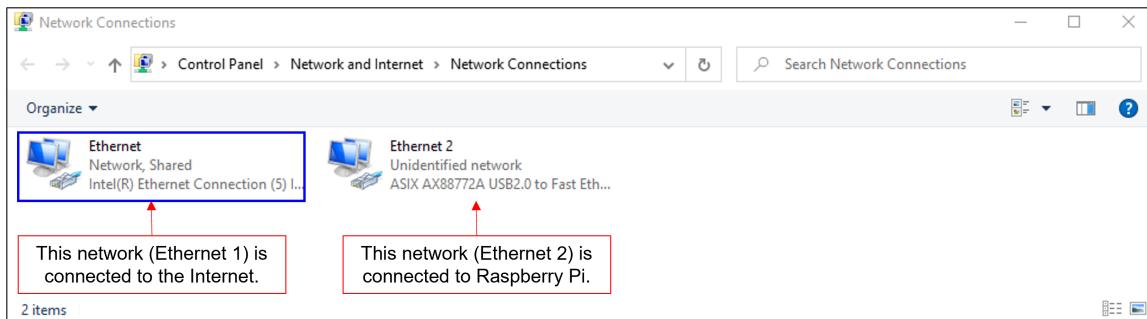

```
PS C:\Users\az2973\Documents\GitHub\purdue_me597> ping 192.168.137.2
Pinging 192.168.137.2 with 32 bytes of data:
Reply from 192.168.137.2: bytes=32 time<1ms TTL=64
Ping statistics for 192.168.137.2:
 Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
 Approximate round trip times in milli-seconds:
 Minimum = 0ms, Maximum = 0ms, Average = 0ms
PS C:\Users\az2973\Documents\GitHub\purdue_me597>
```

## 1.5 Internet connection sharing

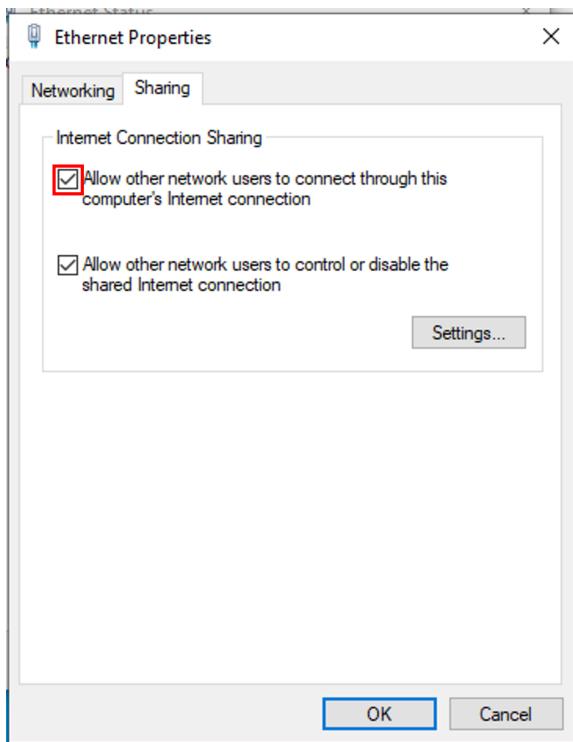

In some cases, you may experience that Raspberry Pi cannot be connected to the Wifi. For example, Purdue's open Wifi (eduroam or PAL3.0) does not allow the Internet connection from Raspberry Pi because of security reasons. However, Raspberry Pi can use the laptop's internet connection via internet connection sharing. Leave the ethernet cable connection between laptop and Raspberry Pi and follow the step below.

1. Open '*Network Connections*' of '*Control Panel*'
2. Double click your network that is connected to the Internet (not the '*Ethernet #*' connected to Raspberry

Pi; in this case, the network '*Ethernet*' is connected to the Internet. If you are using Wifi, you should choose it.)

3. Click 'Properties'
4. Check 'Allow other network users to connect through this computer's Internet connection' box in 'Sharing' tab (You may need to select the network (Ethernet) connected to Raspberry Pi of 'Home networking connection' if you have more than 2 networks.)

5. Click 'OK'

Now, you are all set for the network connection. Although Raspberry Pi does not have Wifi connection, it can access the Internet via the network connection to laptop. Try ping test by performing Task 1.4

## Task 1.4

Capture your ping test results from the Raspberry Pi to Purdue webpage ([purdue.edu](http://purdue.edu), [ping](http://ping.purdue.edu) [purdue.edu](http://purdue.edu)) and attach it to the report below:

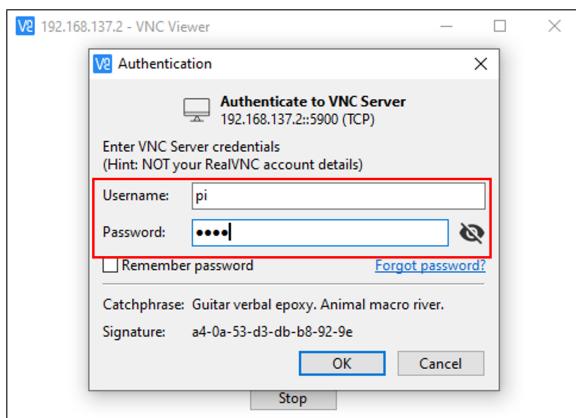

⌘ If want to halt a process or execution in the terminal, the shortcut is *Ctrl+c*.

```
pi@jinyiyuan:~ $ ping purdue.edu
PING purdue.edu (128.210.7.200) 56(84) bytes of data.
64 bytes from purdue.edu (128.210.7.200): icmp_seq=1 ttl=236 time=29.9 ms
64 bytes from purdue.edu (128.210.7.200): icmp_seq=2 ttl=236 time=42.6 ms
64 bytes from purdue.edu (128.210.7.200): icmp_seq=3 ttl=236 time=31.1 ms
64 bytes from purdue.edu (128.210.7.200): icmp_seq=4 ttl=236 time=32.6 ms
^C
--- purdue.edu ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 7ms
rtt min/avg/max/mdev = 29.855/34.038/42.605/5.039 ms
pi@jinyiyuan:~ $
```

## 1.6 VNC access using VNC Viewer

In Prelab 1, you've installed VNC Viewer on your laptop. Follow the direction below. If you are using Linux, use Remmina instead of VNC Viewer.

1. Run VNC Viewer on your laptop
2. Type your IP address ([192.168.137.2](http://192.168.137.2)) or the host name of the Raspberry PI (johndoe.local) and then hit '*Enter*'
3. Type your login credential (username and password) on the pop-up window

4. Click 'OK'

If you see the error window as Figure 4, go to the next, **Troubleshooting Help**, to resolve the display issue.

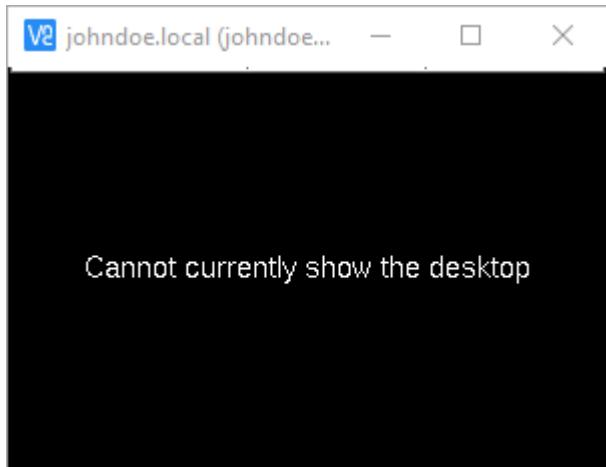

Figure 4 VNC Viewer Error

Now you will see the familiar screen like Figure 5. Play with it! The names of the Taskbar Icons are in Figure 6. If you create an account of RealVNC (<https://www.realvnc.com/en/raspberrypi/>) and your Raspberry Pi is connected to the Internet, you can also access Raspberry Pi via the Internet that means your laptop and Raspberry Pi do not need to be on the same local network for VNC access. A nice instruction is in MagPi (<https://magpi.raspberrypi.com/articles/vnc-raspberry-pi>, available on Jan. 13, 2022). Try file transfer using VNC Viewer between Raspberry Pi and laptop as well.

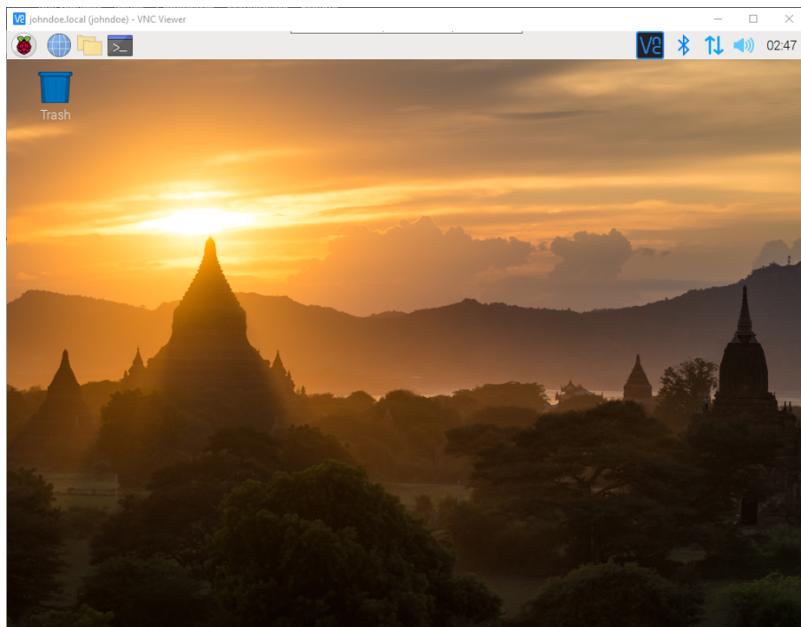

Figure 5 Raspberry Pi GUI using VNC Viewer

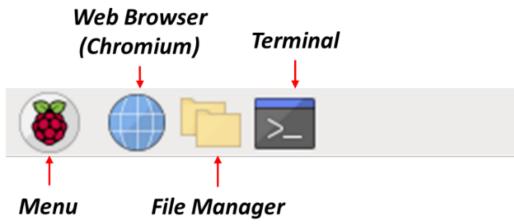

Figure 5 Taskbar Icons of Raspberry Pi GUI

## Troubleshooting Help

After you start Raspberry Pi without display connection to it, you may see VNC access error, "Cannot currently show the desktop" as Figure 4. This is because Raspberry Pi cannot have monitor to show output without any connected display. But SSH works. Try it using PuTTY:

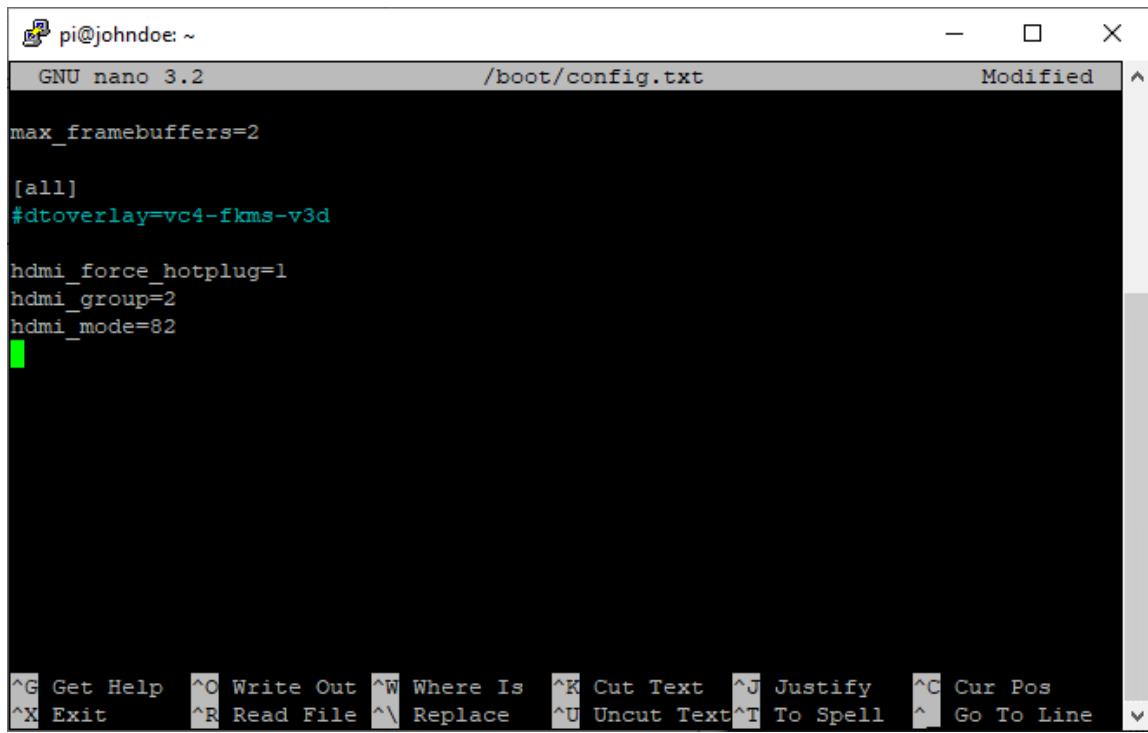

To resolve this issue, you need to make Raspberry Pi have forced display input when booted. Follow the step below after access the Raspberry Pi using PuTTY.

1. Type `sudo nano /boot/config.txt`
  2. Write following at the end of 'config.txt'
- 

### Raspberry Pi - `/boot/config.txt`

```
hdmi_force_hotplug=1
hdmi_group=2
hdmi_mode=82
```

---

```
pi@johndoe: ~
GNU nano 3.2 /boot/config.txt Modified
max_framebuffers=2

[all]
dtoverlay=vc4-fkms-v3d

hdmi_force_hotplug=1
hdmi_group=2
hdmi_mode=82
```

^G Get Help ^O Write Out ^W Where Is ^K Cut Text ^J Justify ^C Cur Pos  
^X Exit ^R Read File ^Y Replace ^U Uncut Text ^T To Spell ^L Go To Line

- `hdmi_force_hotplug=1` means making a forced plugin of HDMI port 1.
- `hdmi_group=2` means DMT (Display Monitor Timings) group which is the same as a monitor.
- `hdmi_mode=82` means resolution is 1920x1080 in 60 Hz. You can change resolution you want according to your

preference or your laptop display resolution. Refer to Table and Raspberry Pi documentation ([https://www.raspberrypi.com/documentation/computers/config\\_txt.html](https://www.raspberrypi.com/documentation/computers/config_txt.html), available on Jan. 13, 2023)

| hdmi_mode | Resolution        | Aspect Ratio | Refresh Rate |
|-----------|-------------------|--------------|--------------|
| 5         | 640x480 (480p)    | 4:3          | 60 Hz        |
| 9         | 800x600           | 4:3          | 60 Hz        |
| 16        | 1024x768          | 4:3          | 60 Hz        |
| 51        | 1600x1200         | 4:3          | 60 Hz        |
| 82        | 1920x1080 (1080p) | 4:3          | 60 Hz        |
| 85        | 1280x720 (720p)   | 4:3          | 60 Hz        |

---

After saving the 'config.txt' file, reboot Raspberry Pi. Try to access VNC again. Is it working?

Now, you are all set for a headless computer for remote access. In the following lab, you do not need to bring any physical interfaces, a monitor, keyboard, or mouse.

## 1.7 Raspberry Pi terminal and packages

The terminal is a useful application. It allows you to navigate file directories and control your Raspberry Pi using typed commands instead of clicking on menu options. It's often in many tutorials and project guides, including the ones on our website.

In addition, we can take advantage of Raspberry Pi packages. In the terminal, we can install, uninstall, and manage the packages.

Let's try to install a Linux package. Install 'tmux' package on your Raspberry Pi using command below.

---

### Raspberry Pi - Terminal

```
sudo apt install tmux -y
```

---

If you don't know or are unclear about a Linux command, google it! Or you can see a manual using command 'man packagename' such as below. Try 'man tmux'.

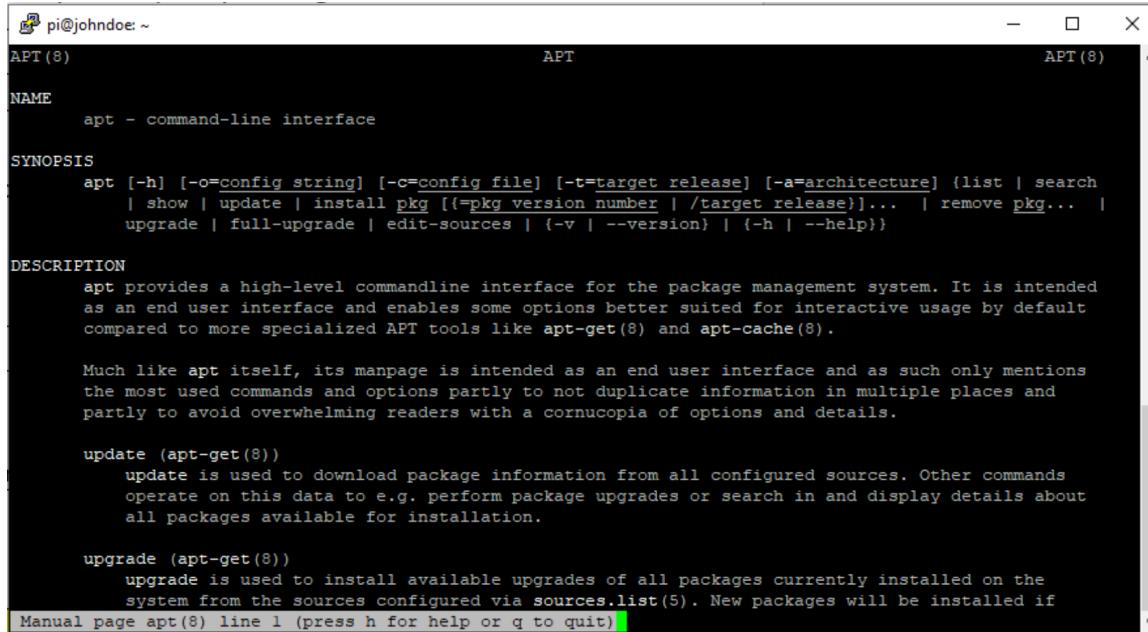

---

### Raspberry Pi - Terminal

```
man apt
```

---

- This shows the manual document of 'apt' command.
- Tips: to change page, press PgUp or PgDn and to exit, press 'q'.

```
pi@john Doe: ~
APT (8) APT APT (8)

NAME
 apt - command-line interface

SYNOPSIS
 apt [-h] [-o=config_string] [-c=config_file] [-t=target_release] [-a=architecture] {list | search
 | show | update | install pkg [{=pkg_version_number} | /target_release]}... | remove pkg... |
 upgrade | full-upgrade | edit-sources | {-v | --version} | {-h | --help} }

DESCRIPTION
 apt provides a high-level commandline interface for the package management system. It is intended
 as an end user interface and enables some options better suited for interactive usage by default
 compared to more specialized APT tools like apt-get(8) and apt-cache(8).

 Much like apt itself, its manpage is intended as an end user interface and as such only mentions
 the most used commands and options partly to not duplicate information in multiple places and
 partly to avoid overwhelming readers with a cornucopia of options and details.

 update (apt-get(8))
 update is used to download package information from all configured sources. Other commands
 operate on this data to e.g. perform package upgrades or search in and display details about
 all packages available for installation.

 upgrade (apt-get(8))
 upgrade is used to install available upgrades of all packages currently installed on the
 system from the sources configured via sources.list(5). New packages will be installed if
 Manual page apt(8) line 1 (press h for help or q to quit)
```

Figure 2 Manual of 'apt' command

It is recommended to go through a Raspberry Pi terminal guideline (<https://raspberrypi-guide.github.io/programming/working-with-the-command-line>, available on Jan. 13, 2023).

Try update and upgrade packages using `sudo apt update` and `sudo apt upgrade`.

---

## Task 1.5

Capture your terminal after upgrading packages using `apt` command and attach it in the space below:

---

```

pi@junyiyan:~ $ apt
apt 1.8.2.3 (armhf)
Usage: apt [options] command

apt is a commandline package manager and provides commands for
searching and managing as well as querying information about packages.
It provides the same functionality as the specialized APT tools,
like apt-get and apt-cache, but enables options more suitable for
interactive use by default.

Most used commands:
 list - list packages based on package names
 search - search in package descriptions
 show - show package details
 install - install packages
 reinstall - reinstall packages
 remove - remove packages
 autoremove - Remove automatically all unused packages
 update - update list of available packages
 upgrade - upgrade the system by installing/upgrading packages
 full-upgrade - upgrade the system by removing/installing/upgrading packages
 edit-sources - edit the source information file

See apt(8) for more information about the available commands.
Configuration options and syntax is detailed in apt.conf(5).
Information about how to configure sources can be found in sources.list(5).
Package and version choices can be expressed via apt_preferences(5).
Security details are available in apt-secure(8).

This APT has Super Cow Powers.

pi@junyiyan:~ $
```

---

## 1.4 Looking Forward to Lab 2 (Router Network Connection)

At the beginning of Lab 2, you will be instructed with the SSID (Service Set Identifier) and password of the Wifi that we will continue using all following lab sessions. Access your Raspberry Pi using SSH or VNC Viewer. Connect the Wifi on Raspberry Pi. Check your IP address using 'ifconfig' command in 'Terminal'. And then, let TA know the IP address (wlan0).

In addition, in the lab, your laptop should be in the same network. Connect the Wifi on your laptop. And then check your Wifi IP address of your laptop using 'ipconfig' command in 'Command Prompt', and let TA know it.

TA will assign the static IP address of your laptop and Raspberry Pi. Note the two IP addresses.

Now, you do not need to use the ethernet cable anymore in lab. Try the section above (Remote access to Raspberry Pi) using Wifi network in the lab.

## Deliverable

Response to the following prompts

```
In []: #@title 1. Summarize Lab0 (e.g., what did you Learn?)
Text = 'in lab 0 I learned how to use putty and vnc to remote into the raspberry pi
print(Text)

in lab 0 I learned how to use putty and vnc to remote into the raspberry pi, and h
ow to assign static ip addresses. Also how to share internet bettwen the laptop an
d the raspberry pi. and how to use sudo apt get update upgrade
```

```
In []: #@title 2. Compare SSH and VNC. What are the pros and cons of each remote access me
Text = '''
ssh: pros: fast, light weight, easyer to use after getting used to command line int
vnc: pros: have a UI. better for people who not yet used to CLI; con: much heavier
''' #@param {type:"string"}

print(Text)
```

```
ssh: pros: fast, light weight, easyer to use after getting used to command line in
terface; con: sometime some program may draw something on the screen. the ssh will
not see it if remote through termial
vnc: pros: have a UI. better for people who not yet used to CLI; con: much heavier
than ssh, meaning not all singal board computer can run it smoothly, it also eat u
p more ethernet bandwidth.
```

## Task 1.6

Model Unit 1 (prelab + lab) by creating a flow diagram that illustrates the logic, sequence, and processes of the unit.

---
